

**Expt-2:****Run a basic Word Count Map Reduce program to understand Map Reduce Paradigm.****AIM:**

To run a basic Word Count MapReduce program using Hadoop.

**PROCEDURE:****1. Create Data File:**

```
nano word_count_data.txt
```

**Example content for word\_count\_data.txt:**

Hadoop is a framework that allows for distributed processing of large data sets.

**2. Mapper Program (mapper.py):**

```
import sys

for line in sys.stdin:

    line = line.strip()

    words = line.split()

    for word in words:

        print(f'{word}\t1')
```

**3. Reducer Program (reducer.py):**

```
import sys

current_word = None

current_count = 0

word = None

for line in sys.stdin:

    line = line.strip()

    word, count = line.split('\t', 1)

    try:

        count = int(count)

    except ValueError:

        continue
```

```
if current_word == word:
    current_count += count
else:
    if current_word:
        print(f'{current_word}\t{current_count}')
    current_count = count
    current_word = word
```

```
if current_word == word:
    print(f'{current_word}\t{current_count}')
```

**4. Set Hadoop Environment:**

```
hdfs dfs -mkdir /word_count_input
hdfs dfs -copyFromLocal word_count_data.txt /word_count_input
```

**5. Run Word Count Program:**

```
hadoop jar $HADOOP_HOME/share/hadoop/tools/lib/hadoop-streaming-*.jar \
-input /word_count_input/word_count_data.txt \
-output /word_count_output \
-mapper mapper.py \
-reducer reducer.py
```

**6. Check Output:**

```
hdfs dfs -cat /word_count_output/part-00000
```

**OUTPUT:**

```
suganya@Ubuntu:~$ hdfs dfs -cat /wordCount/output/part-r-00000
2024-09-28 23:49:13,541 WARN util.NativeCodeLoader: Unable to load native-hadoop library for your platform... using builtin-java classes where applicable
Hi      1
am      1
are     2
fine    2
hi      1
how     1
I       1
you     1
suganya@Ubuntu:~$
```

**RESULT:**

Thus, the program for basic Word Count Map Reduce has been executed successfully.
