## Ex No 6

Import a JSON file from the command line. Apply the following actions with the data present in the JSON file where, projection, aggregation, remove, count, limit, skip and sort

## AIM:

To import a JSON file from the command line and apply the following actions with the data present in the JSON file where, projection, aggregation, remove, count, limit, skip and sort using jq tool.

#### **PROCEDURE:**

- Create a json file 'employees.json' and provide data in it.
- Open the command prompt.
- Navigate to the folder where employees.json is stored.
- Load and view the JSON data with jq.
- Use the jq commands for projection, aggregation, removal, counting, limiting, and sorting operations.

# employees.json:

```
"salary": 55000
  },
    "id": 3,
    "name": "Charlie Davis",
    "department": "Engineering",
    "age": 25,
    "salary": 60000
  },
    "id": 4,
    "name": "Dana Lee",
    "department": "Human Resources",
    "age": 40,
    "salary": 65000
  },
    "id": 5,
    "name": "Eve Martinez",
    "department": "Finance",
    "age": 45,
    "salary": 75000
OUTPUT:
```

# Running jq queries:

# I. Projection:

```
suganya@Ubuntu: $ python3 process_data.py
Raw JSON Data: [
{"name": "John Doe", "age": 30, "department": "HR", "salary": 50000},
{"name": "Jane Smith", "age": 25, "department": "IT", "salary": 60000},
{"name": "Alice Johnson", "age": 35, "department": "Finance", "salary": 70000},
{"name": "Bob Brown", "age": 28, "department": "Marketing", "salary": 55000},
{"name": "Charlie Black", "age": 45, "department": "IT", "salary": 80000}]
```

# II. Aggregation:

```
Aggregation: Calculate total salary
Total Salary: 315000
```

## III. Count:

```
Count: Number of employees earning more than 50000
Number of High Earners (>50000): 4
```

#### IV. Remove:

```
Filtered DataFrame (IT department removed):

name age department salary
0 John Doe 30 HR 50000
2 Alice Johnson 35 Finance 70000
3 Bob Brown 28 Marketing 55000
```

## V. Limit:

```
Limit: Top 5 highest salary
            name
                   age department
                                    salary
   Charlie Black
                    45
                                IT
                                     80000
                    35
2
   Alice Johnson
                           Finance
                                     70000
      Jane Smith
                    25
                                IT
                                     60000
3
                                     55000
       Bob Brown
                    28
                        Marketing
0
        John Doe
                    30
                                     50000
```

# VI. Skip:

```
Skipped DataFrame (First 2 rows skipped):
name age department salary
2 Alice Johnson 35 Finance 70000
3 Bob Brown 28 Marketing 55000
4 Charlie Black 45 IT 80000
```

## VII. Sort:

```
Sorted DataFrame by Name:
                   age department
                                    salary
            name
                    35
                          Finance
                                     70000
   Alice Johnson
                                     55000
       Bob Brown
                        Marketing
3 4 1
                    28
                    45
                                     80000
   Charlie Black
                    25
                                IT
      Jane Smith
                                     60000
        John Doe
                    30
                                HR
                                     50000
```

## **RESULT:**

Thus to import a JSON file from the command line and apply the following actions with the data present in the JSON file where, projection, aggregation, remove, count, limit, skip and sort using jq tool is completed successfully.
